DIAGNOdent pen 2190

Introduction | [Display](#) | [Perio probe](#) | [Caries detection](#) | [Scientifically proven](#) | [Benefits / Treatment procedure](#) | [Features](#) | [Function](#) | [Test now!](#)

Perfect findings in every application

Three reliable methods that together ensure a perfect caries diagnosis:

- Your trained expert eye,
- x-ray imaging and the
- DIAGNOdent pen.

Caries in its early stages and hidden caries can thus be reliably detected. **This enables minimally invasive treatments, the patient is subjected to less stress, and more tooth substance is retained.**

45,000 enthusiastic clinicians already own a DIAGNOdent pen. Nearly 10 years of experience with fluorescent laser technology clearly demonstrate that the identification of caries with the DIAGNOdent pen is a valuable adjunct to conventional methods, and also enables the reliable and comfortable identification of calculus during periodontic sessions.

Quick and reliable knowledge

- Children and adolescents in particular have fissure caries in nearly 80% of all cases
- **Iceberg syndrome:** 90% of caries is invisible (under an intact enamel surface and in the proximal region)
- The DIAGNOdent pen augments the dentist's eye and x-rays: **90% of all cases are identified**
- **Identification of caries in its early stages**
- Applications: **Fissure carries, proximal caries, periodontitis**
- For **greater success in your practice and increased patient loyalty**
